FOUNDATION

# Pure function

# Functions with side effects are not pure

# Functional programming is useless *

Simon Peyton Jones co-author of haskell

A pure function cannot do anything

it can only produce a value

# Create a value that describes actions

Create a value that describes actions

Interpret this value in Main

## 1. Encode description of actions

```
trait Description[A]
```

## 2. Define an interpreter of Description

```
def unsafeRun[A](fa: Description[A]): A = ???
```

## 3. Combine everything in Main

```
object Main extends App {

  val description: Description[Unit] = ???

  unsafeRun(description)

}
```

# Run side effects at the edges

# Examples of description / evaluation

# Cooking

## 1. Secret pasta recipe (Description)

1. Boil 200 ml of water
2. Add 250 g of dry pasta
3. Wait 11 minutes
4. Drain the pasta

## 2. Cook (Unsafe evaluation)

Take the recipe and do it at home

# String diagrams compose

Seven Sketches in Compositionality: An Invitation to Applied Category Theory

# Mathematical formula

```
val x = 2
// x: Int = 2
val y = 3
// y: Int = 3
val x2 = Math.pow(x, 2)
// x2: Double = 4.0
val y2 = Math.pow(y, 2)
// y2: Double = 9.0
val z  = Math.sqrt(x2 + y2)
// z: Double = 3.605551275463989
```

# Mathematical formula

```
val x2 = Math.pow(x, 2)
// x2: Double = 4.0
val y2 = Math.pow(y, 2)
// y2: Double = 9.0
val z  = Math.sqrt(x2 + y2)
// z: Double = 3.605551275463989

Math.pow(z, 2)
// res1: Double = 12.999999999999998
x2 + y2
// res2: Double = 13.0
```

# How to encode description?

```
trait Description[A]

def unsafeRun[A](fa: Description[A]): A = ???
```

# Thunk

```scala
type Thunk[A] = () => A  // Unit => A

def writeLine(message: String): Thunk[Unit] =
  () => println(message)

val today: Thunk[LocalDate] =
  () => LocalDate.now()

def fetch(url: String): Thunk[Iterator[String]] =
  () => scala.io.Source.fromURL(url)("ISO-8859-1").getLines
```

# Thunk

```
type Thunk[A] = () => A  // Unit => A

def writeLine(message: String): Thunk[Unit] =
  () => println(message)

val today: Thunk[LocalDate] =
  () => LocalDate.now()

def fetch(url: String): Thunk[Iterator[String]] =
  () => scala.io.Source.fromURL(url)("ISO-8859-1").getLines
```

```
def unsafeRun[A](fa: Thunk[A]): A = fa()
```

# Thunk

```scala
type Thunk[A] = () => A  // Unit => A

def writeLine(message: String): Thunk[Unit] =
  () => println(message)

val today: Thunk[LocalDate] =
  () => LocalDate.now()

def fetch(url: String): Thunk[Iterator[String]] =
  () => scala.io.Source.fromURL(url)("ISO-8859-1").getLines
```

```scala
def unsafeRun[A](fa: Thunk[A]): A = fa()
```

```scala
val google = fetch("http://google.com")
// google: () => Iterator[String] = <function0>
unsafeRun(google).take(1).toList
// res3: List[String] = List(
//   "<!doctype html><html itemscope=\"\" itemtype=\"http://schema.org/WebPage\" lang=\"en\"><head><meta content=\"S
```

  def effect[A](block: => A): IO[A] = ???

  def fail[A](error: Throwable): IO[A] = ???

}

trait IO[A] {
  def unsafeRun(): A
}
```

# IO Exercises

`exercises.sideeffect.IOExercises.scala`

# IO Summary

- An `IO` is a thunk of potentially impure code
- Composing `IO` is referentially transparent, nothing get executed
- It is easier to test `IO` if they are defined in a interface

# IO Execution

# IO execution

```
case class UserId (value: String)
case class OrderId(value: String)

case class User(userId: UserId, name: String, orderIds: List[OrderId])
```

```
def getUser(userId: UserId): IO[User] =
  IO.effect{
    val response = httpClient.get(s"http://foo.com/user/${userId.value}")
    if(response.status == 200) parseJson[User](response.body)
    else throw new Exception(s"Invalid status ${response.status}")
  }

def deleteOrder(orderId: OrderId): IO[Unit] =
  IO.effect{
    val response = httpClient.delete(s"http://foo.com/order/${orderId.value}")
    if(response.status == 200) () else throw new Exception(s"Invalid status ${response.status}")
  }
```

# How is it executed?

```
def deleteAllUserOrders(userId: UserId): IO[Unit] =
  for {
    user <- getUser(userId)
    _    <- traverse(user.orderIds)(deleteOrder)
  } yield ()

object Main extends App {

  deleteAllUserOrders(UserId("1234")).unsafeRun()

}
```

Discuss with your neighbour 3-4 min

# How is it executed?

```
def deleteAllUserOrders(userId: UserId): IO[Unit] =
  for {
    user <- getUser(userId)
    // User("1234", "Rob", List("1111", "5555"))
